

How everything works, from your seat.

Luis, this is the whole thing on paper. Two doors, eleven rooms, one file, one chain, your crews, your phone. Read it once. After that you never look it up: the screen tells you what to press.

Nothing to learn. It comes to you.

Every job, every question, every photo lands on the one customer file, and the file tells you the next step. If a screen is confusing, the screen is wrong, not you. Reply to Kevin's email; that thread is the ticket.

0 • THE ONE THING TO KNOW

The notification is the instruction. Nobody has to think.

You never go looking for what to do next. When something needs you, it comes to you, with your name on it, and it says what to do and gives you the button. That is the whole system, and it is the same for Sam, Jonathan, Laura, Obed, Robert, Mike and the crews.

How it reaches you Three ways, all at once: the **bing** and a card on the desk, the **buzz** on your phone, and an **email** with a link straight to that customer's file. Nothing reaches you unless your name is on it. No feed to read, no list to check.

What it says Who, which customer, what to do, and by when. One line. "Obed signed off, 6 photos on the file, invoice when you can." "Material is short at Marchetti, 2 posts, see the photo." "Sold and waiting for a supervisor: Reed, Dana, Melbourne."

What you press Every one ends in a button: **Got it**, **Open the file**, or **Done** with the proof. You press it and the next step opens on the next person by itself. You never decide the order; the last step opens the next one.

If nothing came Then nothing is on you. That is the rule. Not "check just in case". When a job is quiet, it is quiet.

If you ever have to think about what to do next, that is a bug. Tell Kevin which screen, and he fixes the screen, not you.

1 • TWO DOORS, ONE LOGIN

The site on any screen. The app in the truck.

Central Command is the site: kdelaney05-bit.github.io/4-touch-autopilot-central-command. On the desktop in Chrome. On your phone: open it in Safari, Share, Add to Home Screen, and it sits there like an app. Same email and password as the phone app. Forgot it: "Set my password" on the sign-in page mails you a link.

The supervisor app (TruReview Supervisor) is the same file in the truck, through Apple's TestFlight: install TestFlight from the App Store, open Apple's invite email on your phone, Install, same login. Until that invite lands, the site on your home screen does the job.

You hold the keys. Every room opens for you, and **View as** at the top left lets you look through anyone's seat: Obed's board, Sam's queue, a rep's book. Nothing is saved when you do.

Eleven tabs. You live in four of them.

The Line	Everything with a human waiting on the other end. You're up: who tagged you, your customers waiting for an answer, the asks on you, oldest first. Say it: a note to anyone about any customer. My crews and the nugget. Direct lines to one person.
The Village	The whole company, one thread. @ a name and they get it. Say hi there.
Production	Your room. The stage board: every sold customer, who holds them, how many days. My board: the jobs on you. Take the job when it is sold and waiting for a supervisor.
Job Board	Every sold job, where it is, what moved, as sentences. The machine's moves are gold. Tap a card, the file opens beside you.
Files	Every customer. Mine is the ones you hold or are tagged on; Everyone is the whole book. The search box at the top finds anyone by name, street or phone.
Photos	Every picture on every file, newest first, with the crew and the dollars on it.
Office	The office's day: paperwork, permit, invoice, payment, oldest first; the supplier bills; the switches (Kevin's).
The Business • Sales • Pipeline • Marketing	Page one, the reps' side, the leads. Yours to read; not your day.

One customer, one file, every seat writes on it.

Open any customer and you see the whole story in order: their texts and ours, the emails, the team's notes, every step the office took, every photo, every document. Who moved through it, in colour. And the line that matters:

NEXT one sentence, the loudest thing on the file: what happens next and who it is waiting on. Automatic, or a named human. Never a guess.

The buttons across the top:

- **Text** goes to the customer from the company's main line, credited to you. Six seconds to undo. The pre-written lines on the right fill the box; edit, then Send.
- **Tag** is a note to the team the customer never sees. **@Obed**, **@Sam**, **@supers**, **@office**: they get the bing on the desk, the buzz on the phone, and an email with the link to this file.
- **Send to...** hands the file to a seat with a note. **Take the job** puts a sold job on you. **Hand it back** sends it back with why.
- **+ Document** puts a permit, an HOA letter, anything, on the file. **Estimate** builds the itemized estimate the customer taps ACCEPT on.

Three lanes on every file. CHAT is the homeowner's lane, write there like they are reading it. SUPER is you and the crew. OFFICE is staff only; the homeowner can never reach it, the database makes sure.

Asks with a clock. Anything someone has to do is an ask with a name on it and a clock running: the permit, the locate, the material, the install date, your sign-off, the invoice, the payment. Done closes it with the proof (a number, a photo, a date), and the next one opens by itself.

How a job moves, and where you come in.

Nobody decides the next step; the last one opens it. The customer signs, the office's checklist opens on Sam. The last paper in is paperwork official, and the material opens on Jonathan with the order attached. The date is set, and it lands on you.

What lands on you, and when:

- **The job, sold and waiting.** Production room, "sold and waiting for a supervisor". Take it, or it is assigned to you with a note.
- **The work order.** The moment the install date is set, the file writes the work order and emails it to you and to the crew, Spanish and English, with the drawing and the material list. The crew taps RECIBIDO with a name; you see who received it and when.
- **From the field, on your file:** a material run, a site issue, a safety photo, a change order, a ping. Each one is an ask on you with the clock running.
- **Sign-off.** When the work is done: three or more finished photos and your word. That one tap is the trigger for everything after it.

NEXT Your sign-off opens **INVOICE READY** on the office by itself: the signed amount, the deposit, the change orders, your photos, your name, all typed. Laura checks it and taps Approve. You never call about an invoice again.

Today: the nugget and the work order. Next: one login per crew.

Today, no login. On The Line, **My crews:** a crew is a name, a phone and a language. **Send a nugget:** one instruction, the customer and the address, the picture with the scope and the price, and the one thing to bring back (a photo, a number, sí/no, done). They get a text with a link, in Spanish. You hold the receipt: texted, opened, RECIBIDO by name, brought back. Nothing to argue about. Open any photo on a file, **Send to a crew**, and the nugget is already filled.

The work order is the same page for the whole job: the order, the drawing, four big buttons (AQUÍ · FOTOS · LISTO · LLAMAR) and a line to you. Every tap lands on the customer's file with the crew's name.

The text with the link. The moment the install date is set, the crew lead's phone gets a text from the company line, in both languages: the customer, the address, the date, and the link. The page opens in the phone's own language, with two big buttons, ESPAÑOL and ENGLISH, always in view. Nobody is assumed to read Spanish, or English. That link is the room for that job: the crew, you, the supervisor. Everything the crew taps or writes lands on the customer's file in your lane with the crew's name, the photos included, and you get the push. What you write on the file in that lane shows up on their link. No app, no login, no password for a crew, ever. Today the link goes by email only; the text is one switch Kevin flips (**The crew's text**, in the Office room). It needs a phone on the crew's card, which is why the roster matters.

Built the same night, waiting behind the same switch: a text back to the crew when you or anyone writes in their lane, so they never have to reopen the link to see it; a second text at 7 AM on the work date with the job and the link; and if the crew replies to the text itself instead of tapping the link, that reply lands on the file too, with their name and the push to you. They cannot answer in the wrong place. On the link there is also one red button, FALTA MATERIAL: a few words from the crew and you have a material ask with the clock running. **Still to come** **COMING**: the translation both ways, his words kept beside it.

Your name on it, or you never hear about it.

- **@Luis** anywhere (a file, the Village, Say it) is the only way anything reaches you. No feed to read. The card with the bing stays until you tap Got it or Open the file.
- **Turn the bing on**, once, at the top of the site. Without speakers you still get the card and the email.
- **A photo is something you say.** Take it on the file or in the Photos room, put the words, the crew and the dollars on it, tag whoever needs it. It lands on the file and in the Photos room the same second. Sod on the wrong yard never happens twice.

Same file. Five screens.

Today The crew pilot. The crews on the fenced sites right now, arrival and departure stamped by the phone itself. Real crews, real fences, real stamps, or nothing.

Sites • Crews • Pay What is fenced, who is on it, the hours the stamps add up to.

LIVE FILES Every open sold job your login can see. Tap the customer: the file, four lanes (CHAT • SUPER • OFFICE • PHOTOS). TAKE shoots the job and says it with the picture, at whoever you name.

The two-minute film of the real screens: **the "supervisor app" link in Kevin's email**. Watch it once with the sound on.

So you never have to ask.

Sam Paperwork, the permit, the 811 locate, the inspection. The Directors of First Impressions answer the phones.

Jonathan Orders the material, sets the install date with the customer, approves the supplier bills when they land on the file.

Laura The invoice off your sign-off, then the payment.

Jess Central Command over all three companies; every room, like Kevin.

Obed • Robert • Mike Your supervisors: fence, roofing, Oasis. Same rooms as you for their jobs.

The reps Sell, sign on the link, take the survey and the selections. They keep the phone app.

The machine Writes the orders, opens the asks, keeps the clocks, sends the receipts, texts the customer from the main line when Kevin flips a switch. Nags nobody who did their part.

Send it to Kevin. Then keep working the old way.

1. **Reply to Kevin's email**, the one this came with. That thread is the ticket. One line is enough: which screen, the exact words on it, and a screenshot if you can. Do not start a new email; do not let it wait for a meeting.
2. **If a crew is standing there waiting**, text or call Kevin on his cell right then. The email can follow.
3. **Meanwhile, nothing stops**. Contractors Cloud, the phones, the crews' texts: all of it runs exactly as before. Nothing has been switched off. Do it the old way for that one job and say so on the file.
4. **The three fixes that solve most of it**: on the site, tap Refresh at the top, or sign out and back in. In the app, close it all the way and reopen it. On the phone, one wifi bar is worse than none; turn wifi off and try again.
5. **If the app says "Could not reach the live database"** or anything like it, that is a known one: sign out and in once, and if it says it again, send Kevin those exact words and the time. He needs the words, not "it didn't work".
6. **If a crew hits something** (the link will not open, the photo will not send): they tell you, you send it to Kevin the same way. Crews never email Kevin; you are their line.

Nothing you do on a screen can break a job. The worst case is a screen that is wrong, and that gets fixed the same day.

Nothing to learn. It comes to you.

This is not a manual to memorize. It is what is going to happen. The file tells you the next step, the card tells you what to press, and every change ships with a two-minute film. When a screen is confusing, the screen is wrong, not you. Reply to Kevin's email and he fixes the screen. This page gets reprinted as things change; keep the newest one.
